Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Hotel Booking

Experiment No: 7

Name: ROSHAN K
Roll No: 241401083
Department: CSBS

Aim

To integrate the “Hotel Booking” application built in Zoho Creator with Zoho CRM by creating an authorized connection and using a Deluge script to call the connected Zoho service. The integration automatically pushes guest and booking details to Zoho CRM / Calendar when a new room booking is submitted, reducing the need for front-office staff to manually re-enter booking details in other systems.

Procedure

Step 1: Open Microservices – From the Develop section of the Zoho Creator application, the Microservices page was opened and Create New was selected.

Step 2: Choose Connections – From the Create New Microservice options, Connections was selected to connect the Zoho Creator application with a third-party Zoho service.

Step 3: Configure Zoho CRM Connection – A new connection for Zoho CRM was created. The connection name, authorization access, and connection mode were configured.

Step 4: Authorize the Connection – Zoho Creator requested permission to access Zoho CRM. The previously authorized Zoho CRM account was reused to complete the authorization.

Step 5: Enable Connection for the Application – The created Zoho CRM connection was enabled for the Hotel Booking application so that it could be used inside Deluge scripts.

Step 6: Create the Workflow – A new workflow was created for the Hotel Room Booking form, configured to trigger on Created record events after a successful form submission.

Step 7: Write the Deluge Script – A Deluge script was added to the workflow to call the connected service. The script uses the guest name, email address, contact number, room type, number of guests, meal plan, amenities required, and special requests from the submitted booking, along with the check-in date and preferred check-in time, to create a corresponding calendar event.

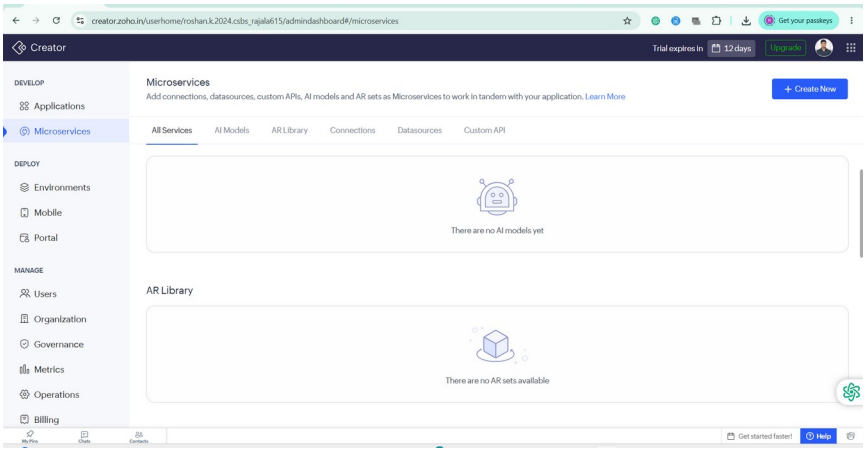

Step 8: Save and Test the Workflow – The Deluge script and workflow were saved. A sample room booking was submitted through the live form, and Zoho CRM was checked to confirm that the connection was active and the integration completed successfully.

Output

3.1 Opening the Microservices Section

The Microservices section was opened from the Develop menu in Zoho Creator. The Create New option was used to begin creating a new service connection for the Hotel Booking application.

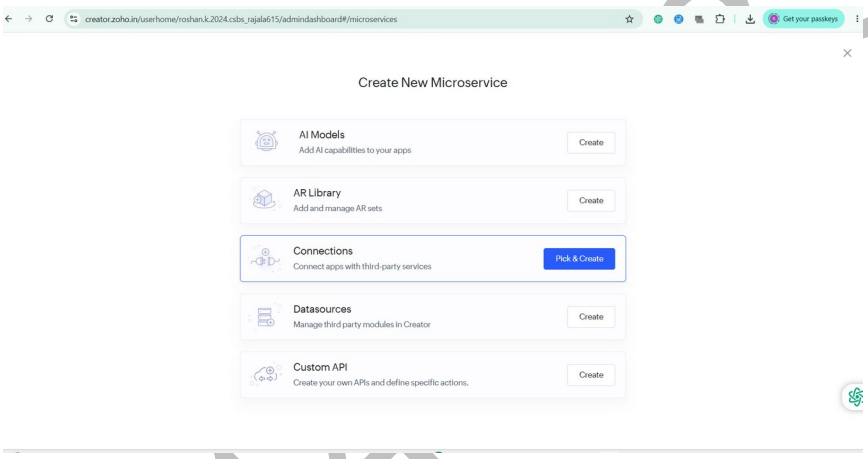

241401083

The Microservices section was opened from the Develop menu in Zoho Creator, showing no AI Models or AR sets yet.

3.2 Choosing the Connections Microservice

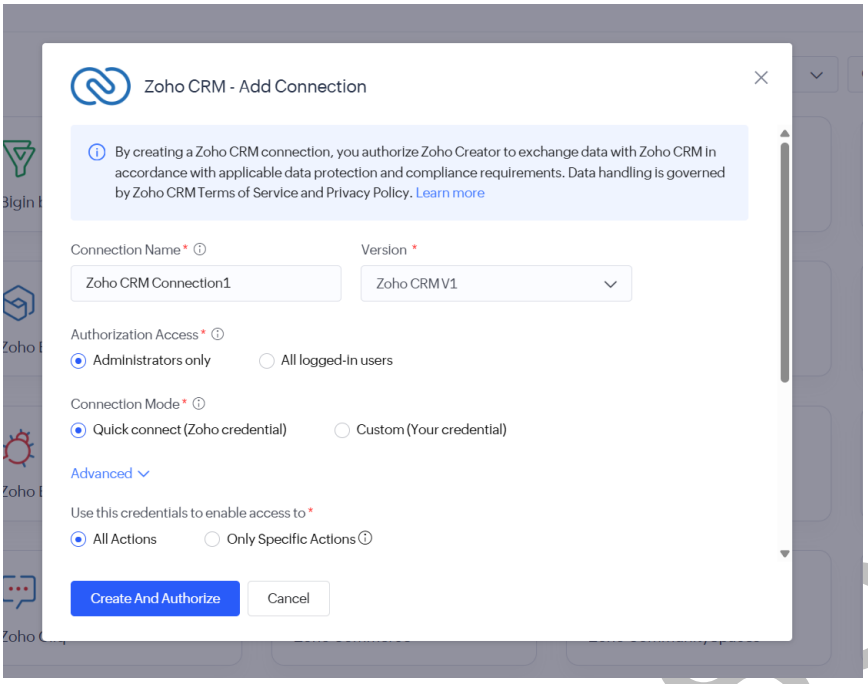

The Connections option was selected from the available microservice types to establish communication between the Zoho Creator application and a third-party Zoho service.

The Connections option was selected from the Create New Microservice panel to link the Hotel Booking application with a third-party service.

3.3 Creating the Zoho CRM Connection

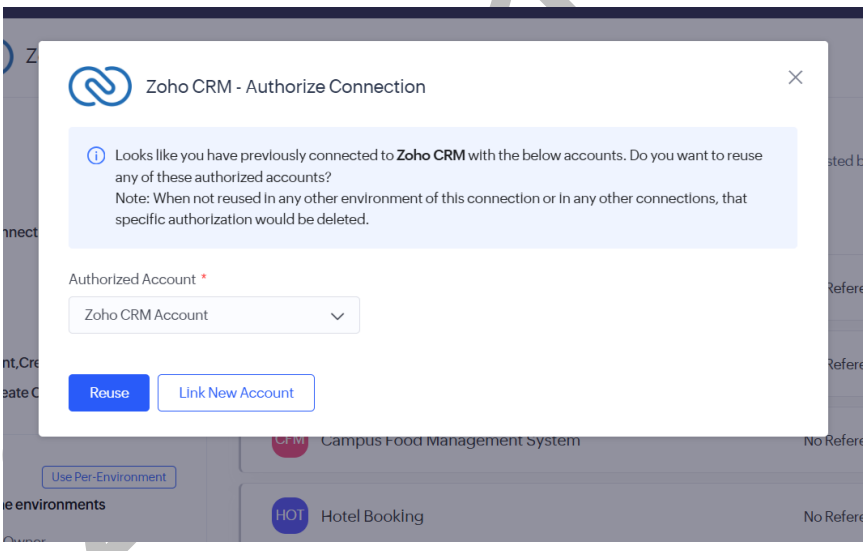

A Zoho CRM connection was created by providing the required connection details, including the connection name, authorization access, and connection mode, along with the necessary permissions.

A Zoho CRM connection was configured with Administrators-only access and Quick Connect (Zoho credential) mode.

3.4 Authorizing the Connection

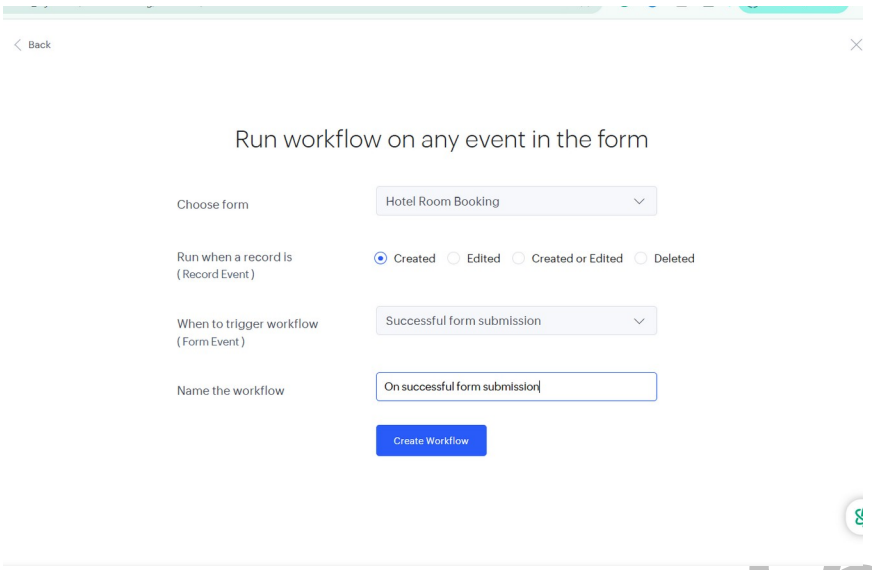

The connection was authorized by granting Zoho Creator the required permissions to access Zoho CRM. Since the account had already been connected previously, the existing authorization was reused instead of creating a new one.

The previously authorized Zoho CRM account was reused, and the connection was linked to the Hotel Booking application.

3.5 Creating the Workflow

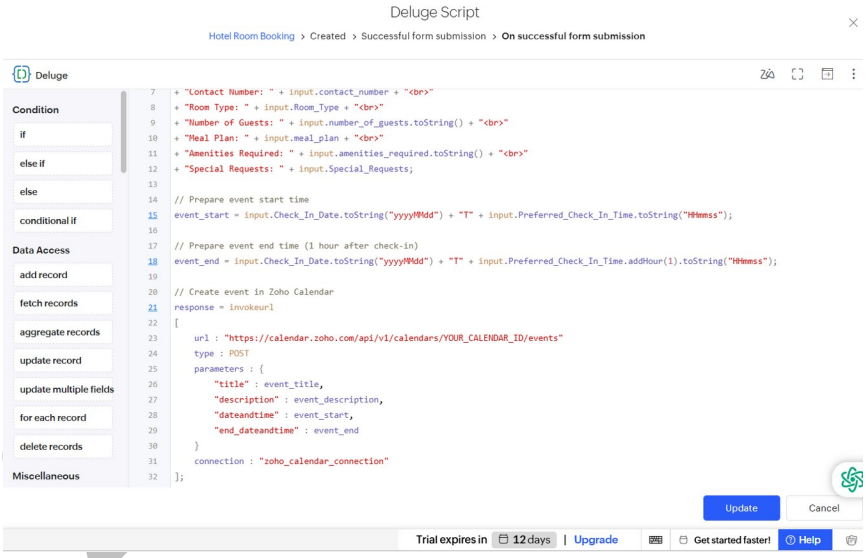

A workflow was created for the Hotel Room Booking form with the record event set to Created and the form event set to Successful form submission, so that the workflow runs automatically every time a new booking is saved.

A workflow was created for the Hotel Room Booking form with the record event set to Created and the form event set to Successful form submission.

3.6 Deluge Script Calling the Connected Service

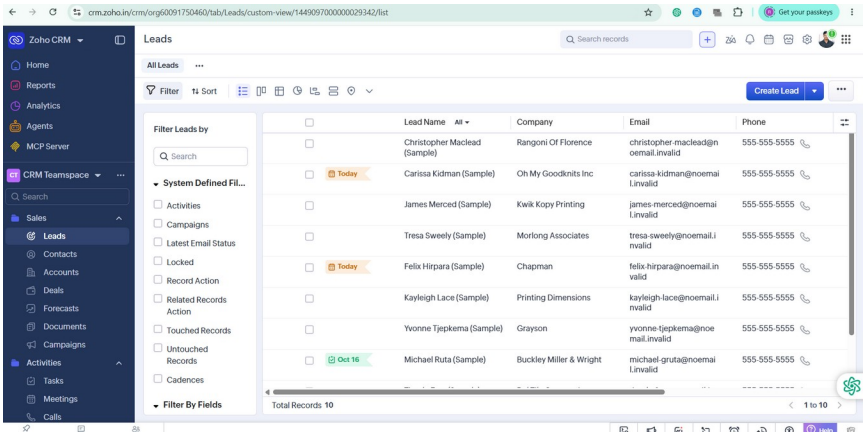

A Deluge script was added to the workflow to communicate with the connected service. The script retrieves the guest name, email address, contact number, room type, number of guests, meal plan, amenities required, and special requests from the submitted booking, and uses the check-in date and preferred check-in time to build and send a corresponding calendar event through the authorized connection.

A Deluge script was added to the workflow to retrieve the booking details and create a corresponding calendar event using the authorized connection.

3.7 Verifying the Integration

To confirm that the integration was working, Zoho CRM was opened directly and checked for the active connection and synced data, verifying that the Hotel Booking application could successfully reach the connected service after a booking was submitted.

Zoho CRM was opened to verify that the connection was active, confirming the Hotel Booking application could successfully reach the connected service.

Result

The Hotel Booking application was successfully integrated with Zoho CRM using a connection and Deluge scripting. When a guest submits the room booking form successfully, the workflow automatically sends the booking information to the connected service and creates a corresponding calendar event. The integration was tested with a sample booking, and the connection was verified to be active. Thus, the objective of integrating a Zoho Creator application with another Zoho service using Connections, APIs, and Deluge scripting was achieved.
