Experiment – 06

Automating Business Processes Using Deluge Scripting and Workflows, with Application Testing and Debugging

Hotel Room Booking & Front Office Management

Name: Roshan K

Roll No: 241401083

Department: B.Tech CSBS

Date: 12th October 2026

Aim

To automate the hotel room booking process by sending a confirmation email automatically when a guest successfully submits the Hotel_Booking_Form, using a Zoho Creator workflow and Deluge script. The automation removes the need for front-office staff to manually acknowledge each booking and ensures every valid request is confirmed immediately.

Procedure

Step 1: Create a Workflow – A new workflow was created for the Hotel_Booking_Form from the Workflow section of the Zoho Creator application.

Step 2: Configure the Trigger – The Record Event was set to Created and the Form Event was set to Successful form submission, so the workflow fires only after a guest's booking request is validated and saved.

Step 3: Name the Workflow – The workflow was named "On successful form submission" and saved.

Step 4: Add a Deluge Action – A new action was added to the workflow. **Deluge script** was chosen as the action type so a customised confirmation email could be generated from the submitted form data.

Step 5: Write the Deluge Script – A *sendmail* script was written to email the guest at the address they submitted. The message embeds dynamic booking information — Guest Name, Contact Number, Number of Guests, Room Type, Meal Plan, Check-In Date, and Preferred Check-In Time — pulled directly from the corresponding input fields of the Hotel_Booking_Form.

Step 6: Save the Workflow – The Deluge script was updated and saved, and the workflow was reviewed to confirm it was attached to the Successful form submission event.

Step 7: Test the Application – A sample hotel room booking was submitted through the live form with valid guest details, room and meal preferences, and a check-in date and time.

Step 8: Debug and Verify – The guest's Gmail inbox was checked after submission. The confirmation email arrived with the correct booking details, confirming that the workflow and Deluge script executed successfully.

Output

1. Choosing the Action

The **Deluge script** action type was selected for the "on successful form submission" workflow so a customised confirmation email could be generated from the submitted booking details.

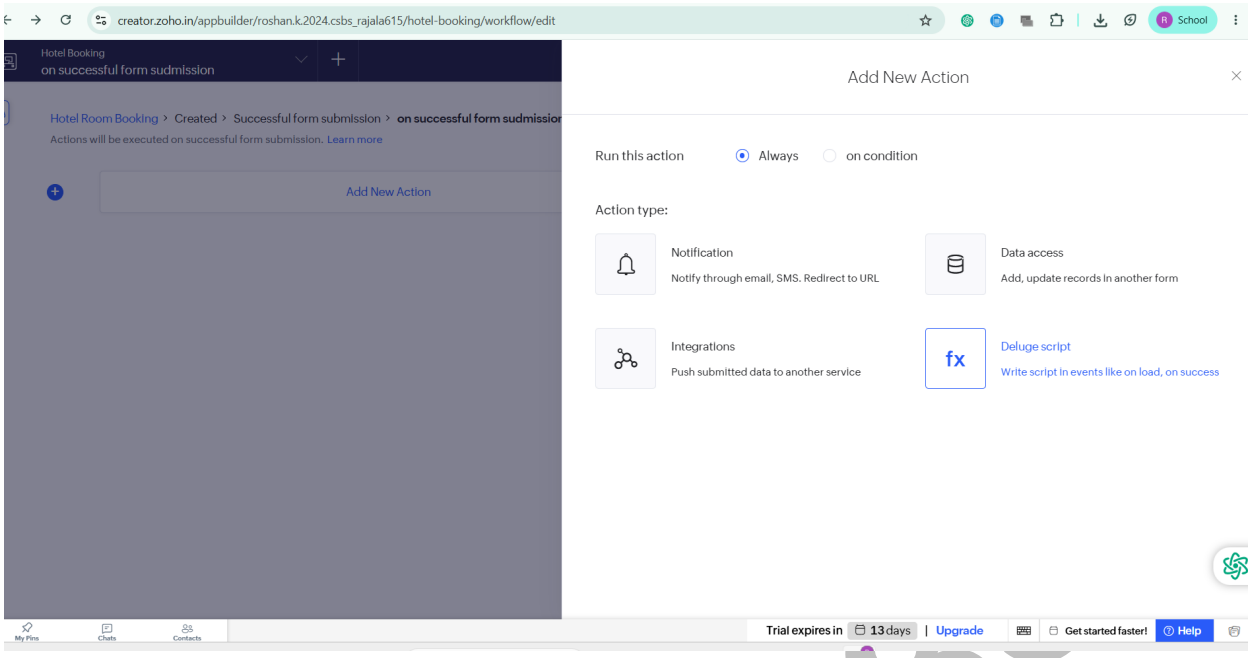

Figure 1. Add New Action — Deluge script selected as the action type.

2. Writing the Deluge Script

The *sendmail* script was written using the guest's email address and dynamic booking information read from the form inputs.

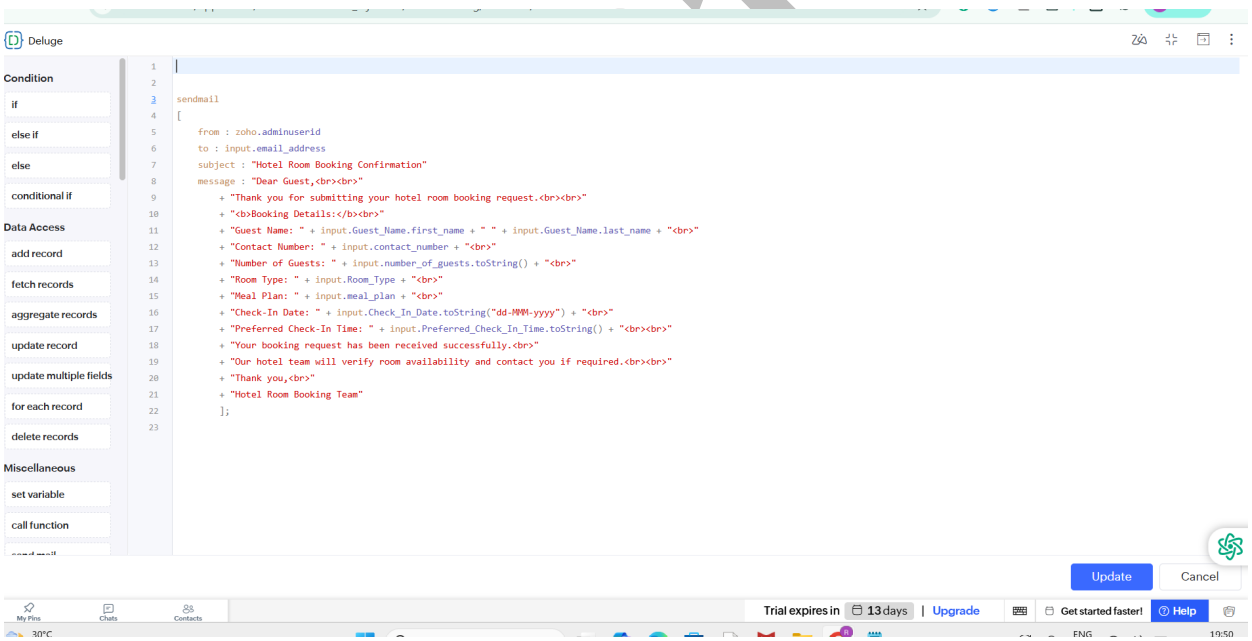

Figure 2. Deluge script generating the Hotel Room Booking Confirmation email.

3. Testing the Booking Form

A sample hotel room booking was submitted through the live Hotel_Booking_Form, filling the Room & Stay Preferences and Scheduling & Policy sections before clicking Submit, to trigger the workflow.

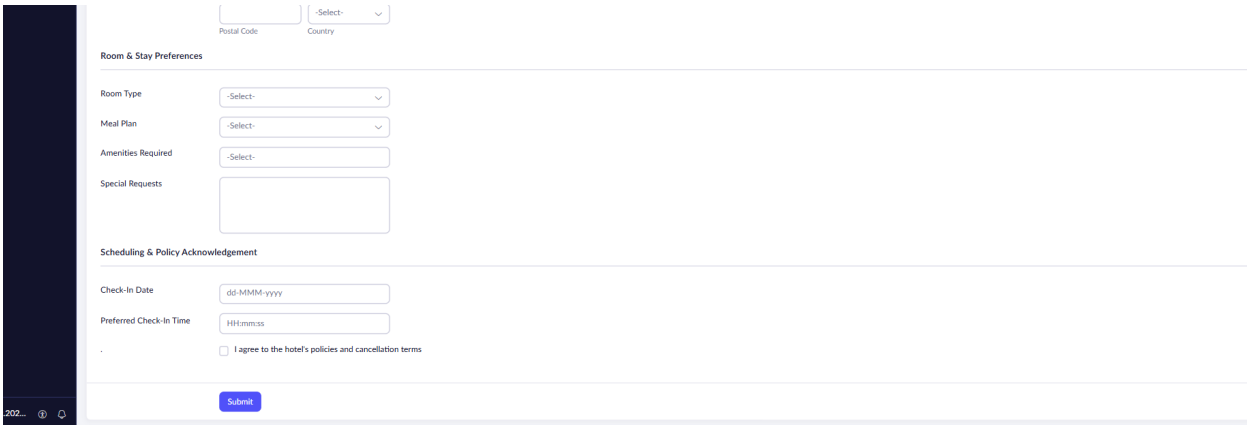

Figure 3. Hotel_Booking_Form — Room & Stay Preferences and Scheduling & Policy sections submitted to trigger the workflow.

4. Confirmation Email

The confirmation email was received successfully with the submitted booking details, demonstrating that the automation worked correctly.

Final Result

A complete workflow was successfully implemented for the **Hotel Room Booking & Front Office Management** application. The workflow automatically sends a personalised confirmation email whenever a guest successfully submits the Hotel_Booking_Form.

The application was tested using a live form submission, and the confirmation email was received with the correct dynamic booking details — Guest Name, Contact Number, Number of Guests, Room Type, Meal Plan, Check-In Date, and Preferred Check-In Time. The hotel booking notification process was thus successfully automated using Zoho Creator Workflows and Deluge scripting.
