Configuring User Management and Role-Based Access Control (RBAC) in a Zoho Creator Application

Hotel Booking

Experiment No: 8

Name: ROSHAN K
Roll No: 241401083
Department: CSBS

Aim

To configure user management and Role-Based Access Control (RBAC) in the Hotel Booking application by creating a dedicated permission set, defining a user role, and setting up a data sharing rule, so that access to forms, reports, and booking records can be controlled according to each user's responsibility.

Procedure

Step 1: Open User Permissions – The User Permissions section was opened from Settings in the Hotel Booking application, under the Permissions tab, to review the existing permission sets (Read and Write).

Step 2: Create a New Permission Set – Add Permission was selected, and a new permission set named “Hotel Room Booking” was created and given access to the Hotel Room Booking module.

Step 3: Verify the Permission Set – The Permissions tab was reopened to confirm that the new “Hotel Room Booking” permission set now appeared alongside the existing Read and Write profiles.

Step 4: Create a Role – Under the Roles tab, a new role named “Front Office Manager” was added, reporting to the CEO role, with a description granting complete access to hotel room booking records, forms, pages, and application management.

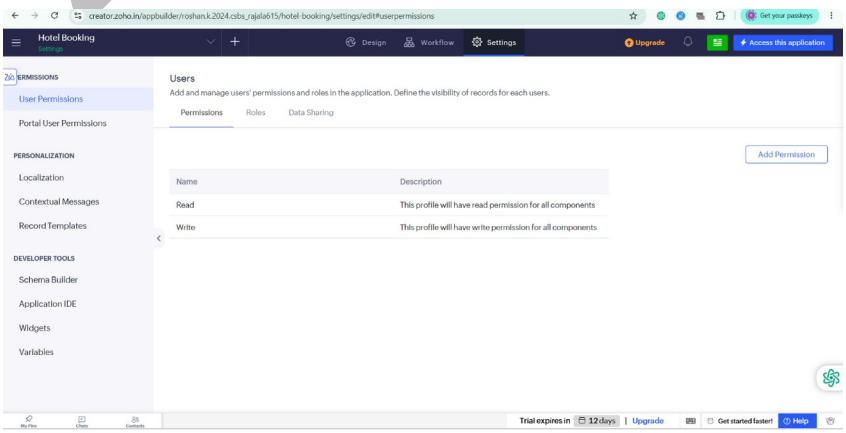

Step 5: Configure a Data Sharing Rule – Under the Data Sharing tab, a new share rule named “hostel user list” was created for the Hotel Room Booking form, sharing records from the Front Office Manager role to the CEO role with Read/Write access.

Step 6: Save and Verify – The permission set, role, and data sharing rule were saved, and each was verified under its respective tab in User Permissions.

Output

3.1 Opening User Permissions

The User Permissions section was opened under Settings, showing the Permissions tab with the default Read and Write profiles before any custom permission set was added.

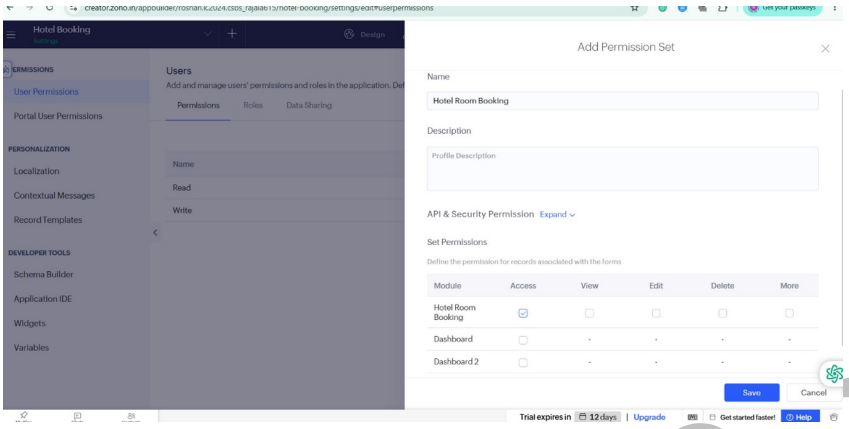

241401083

The Permissions tab of User Permissions, showing the default Read and Write permission sets.

3.2 Creating the Hotel Room Booking Permission Set

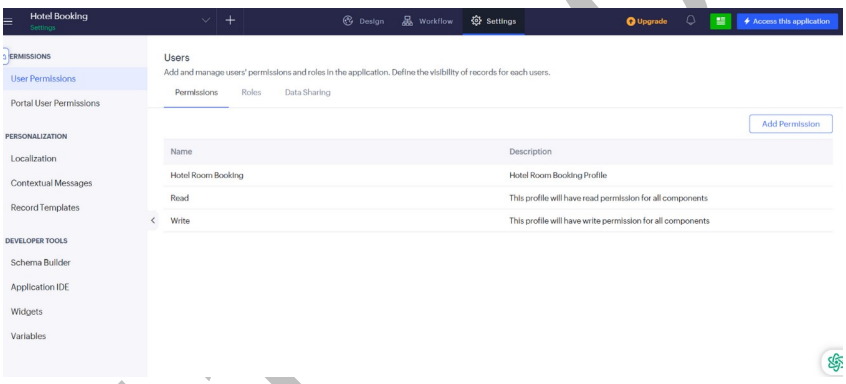

A new permission set named “Hotel Room Booking” was created using Add Permission Set, with access enabled for the Hotel Room Booking module.

The Add Permission Set dialog, configuring the “Hotel Room Booking” profile with access to the Hotel Room Booking module.

3.3 Verifying the Permission Set

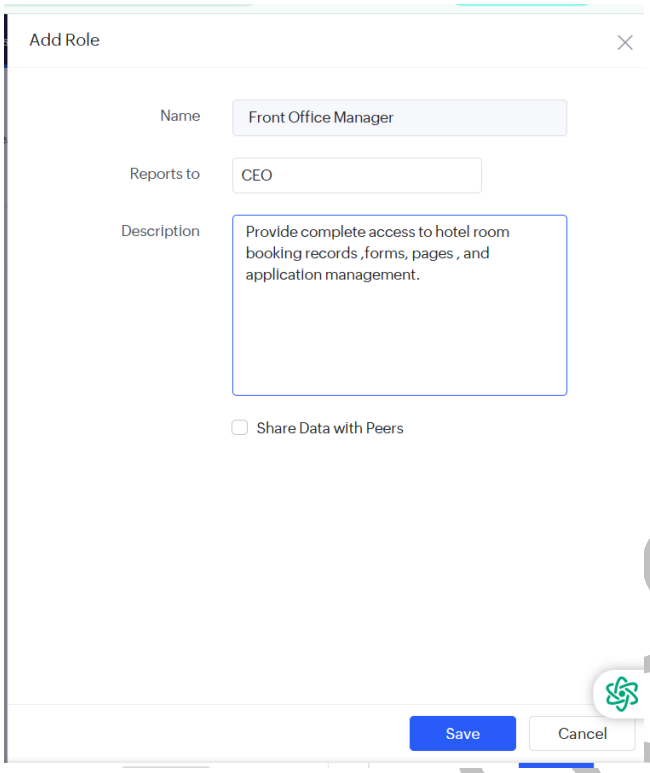

The Permissions tab was checked again to confirm that the “Hotel Room Booking” permission set had been created successfully alongside the Read and Write profiles.

The Permissions tab now listing the Hotel Room Booking profile along with Read and Write.

3.4 Creating the Front Office Manager Role

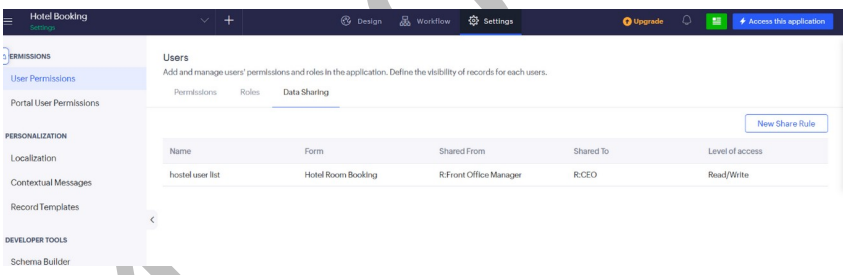

A new role, “Front Office Manager”, was added under the Roles tab, reporting to the CEO role, with a description granting complete access to hotel room booking records, forms, pages, and application management.

The Add Role dialog, creating the Front Office Manager role reporting to CEO.

3.5 Configuring the Data Sharing Rule

A data sharing rule, “hostel user list”, was created under the Data Sharing tab for the Hotel Room Booking form, sharing records from the Front Office Manager role to the CEO role with Read/Write access.

The Data Sharing tab showing the “hostel user list” rule sharing Hotel Room Booking data from Front Office Manager to CEO with Read/Write access.

Result

User management and Role-Based Access Control (RBAC) were successfully configured for the Hotel Booking application. A dedicated “Hotel Room Booking” permission set was created, a “Front Office Manager” role was defined with full access to booking records and application management, and a data sharing rule was set up to extend Read/Write visibility of Hotel Room Booking records from the Front Office Manager role to the CEO role. Thus, user management and role-based access control were successfully implemented and verified in Zoho Creator.
