Exploring AI-Assisted Features and Built-In Analytics (Zia) in Zoho Creator

Hotel Booking

Experiment No: 9

Name: ROSHAN K
Roll No: 241401083
Department: CSBS

Aim

To explore AI-assisted features and built-in analytics using Zia in Zoho Creator by reviewing the Hotel Booking application's form design, prompting Zia to enhance the existing dashboard, and verifying that the AI-generated KPI cards and charts correctly reflect live booking data to support better decision-making.

Procedure

Step 1: Open the Application – The Hotel Booking application was opened in Zoho Creator, and the Hotel Room Booking form was opened in the Design view to review its existing fields under Guest Details and Contact Details.

Step 2: Access Zia (Build Agent) – From the Design view, the Build Agent panel was opened. Zia introduced itself as an AI developer, ready to build or modify application components from a plain-language instruction.

Step 3: Prompt Zia to Enhance the Dashboard – The Dashboard page was opened and the Build Agent panel was used again. A detailed prompt was given asking Zia to enhance the existing Hotel Booking Dashboard with KPI cards for Total Bookings, Total Guests, Average Guests per Booking, Upcoming Check-Ins, and Today's Check-Ins; Room Type and Meal Plan donut charts; a Booking Trends line chart; a City-wise Booking bar chart; a Recent Bookings table; and quick-action buttons for Add Booking and View Reports, all connected to the actual Hotel_Room_Booking data.

Step 4: Generate the Dashboard Components – Zia processed the prompt and began generating the requested KPI tiles and chart widgets directly on the Dashboard page, in a navy-blue and white theme with a responsive layout.

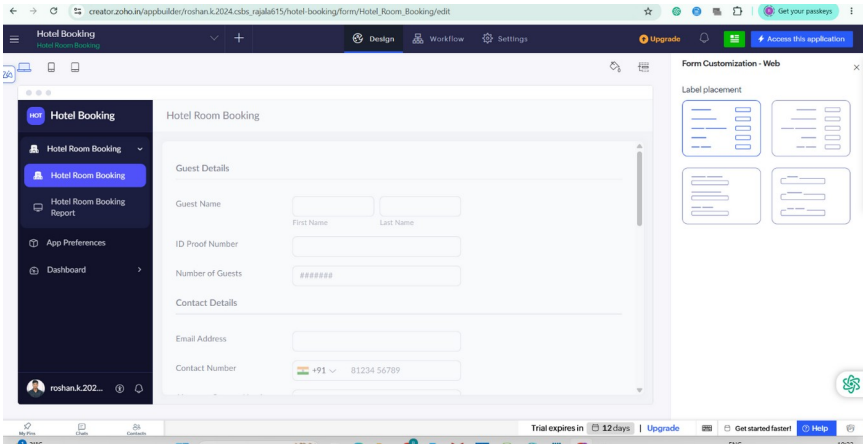

Step 5: Review the Results – The live Dashboard page was opened to verify that the AI-generated Total Bookings, Average Guest Booking, Total Guest, and Upcoming Check-Ins tiles, along with the Room Type and Meal Plan donut charts, correctly reflected the existing booking records without dummy data or duplicate forms.

Output

3.1 Reviewing the Hotel Room Booking Form

The Hotel Room Booking form was opened in the Design view to review its existing fields — Guest Name, ID Proof Number, and Number of Guests under Guest Details, and Email Address and Contact Number under Contact Details — before using Zia.

The Hotel Room Booking form in Design view, showing the Guest Details and Contact Details sections.

3.2 Accessing Zia (Build Agent)

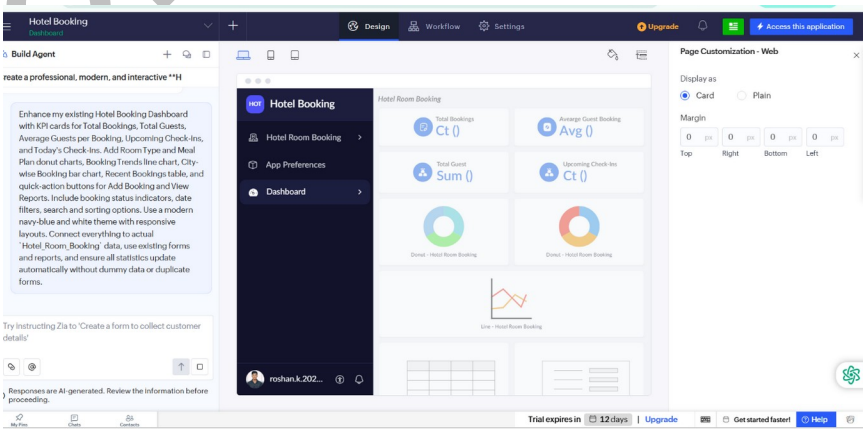

The Build Agent panel was opened from the Design view. Zia introduced itself as an AI developer and offered to build components such as a form from a simple instruction.

The Build Agent (Zia) panel opened within the form builder, ready to accept a build instruction.

3.3 Prompting Zia to Enhance the Dashboard

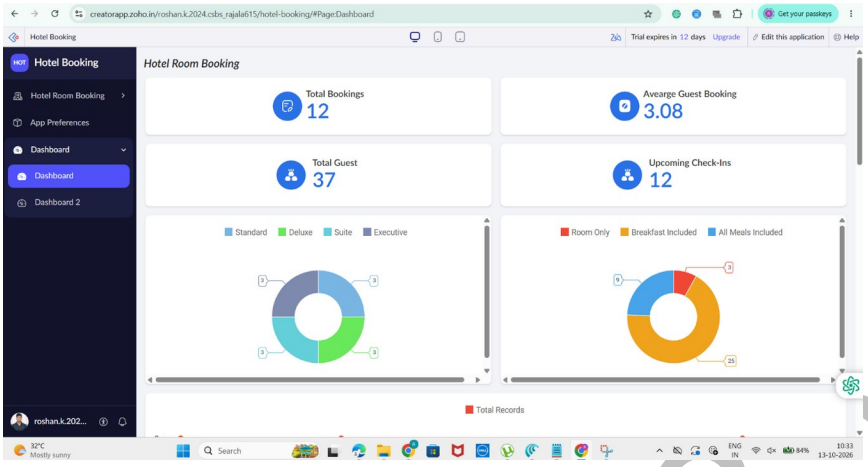

On the Dashboard page, the Build Agent panel was used to submit a detailed prompt asking Zia to enhance the existing Hotel Booking Dashboard with KPI cards, donut charts, a booking trends line chart, a city-wise bar chart, a recent bookings table, and quick-action buttons, all connected to the live Hotel_Room_Booking data.

The prompt given to Zia to enhance the Hotel Booking Dashboard, with the dashboard regenerating in the background.

3.4 Verifying the AI-Enhanced Dashboard

The live Dashboard page was reviewed to confirm that Zia had correctly generated the Total Bookings, Average Guest Booking, Total Guest, and Upcoming Check-Ins KPI tiles, along with the Room Type and Meal Plan donut charts, all reflecting the actual booking data.

The AI-enhanced Hotel Booking Dashboard, showing live KPI tiles and the Room Type and Meal Plan donut charts.

Result

The AI-assisted features and built-in analytics capabilities of Zia in Zoho Creator were explored using the Hotel Booking application. Zia was used to review the existing form design and to enhance the Dashboard page with KPI cards and chart widgets from a single plain-language prompt, connected to the live Hotel_Room_Booking data. The experiment demonstrated how AI-assisted dashboard generation can help users build meaningful visual summaries and support data-driven decision-making in hotel management without manually configuring every chart.
