Experiment – 05

Hotel Room Booking & Front Office Management

Building Reports, Dashboards, and Custom Pages (UI Builder)

Name: Roshan K

Roll No: 241401083

Department: B.Tech CSBS

Date: 30th August 2026

1. Aim

To build a supporting Report and a UI Builder Dashboard for the existing "Hotel_Booking_Form" application in Zoho Creator, enabling front-office staff to view, filter, and analyse submitted room-booking records, and to present key booking metrics — total bookings, total guests, average guests per booking, and upcoming check-ins — through visual dashboard pages.

2. Procedure

2.1 Building the Report

1. Opened the **Reports** section in the left sidebar of the "Hotel Booking" application; Zoho Creator's auto-generated grid report from the Hotel_Booking_Form was renamed **Hotel_Room_Booking_Report**.
2. Verified that every field submitted through the form — ID Proof Number, Number of Guests, Email Address, Contact Number, Permanent Address, and Guest Name — appears as a column and reflects the live submitted records.
3. Enabled the eye icon and column-level sort/filter dropdowns on key columns (ID Proof Number, Number of Guests, Email Address) so front-office staff can quickly locate or sort a specific guest's booking.
4. Submitted five sample bookings through the live form — covering different room types, meal plans, and guest counts — to populate the report with representative test data for verification.

241401083

2.2 Building the Dashboard Pages (UI Builder)

1. Opened **Dashboard** under the application sidebar and used the built-in Dashboard builder to add summary tiles: **Total Bookings**, **Average Guest Booking**, **Total Guest**, and **Upcoming Check-Ins**, each bound to an aggregate (count/average) over Hotel_Room_Booking_Report.
2. Added a donut chart plotting **Room_Type** (Standard / Suite / Executive) against record count, to visualise the distribution of room-category preference across bookings.
3. Added a second donut chart plotting **Meal_Plan** (Room Only / Breakfast Included / All Meals Included) against record count, to visualise meal-plan preference.
4. Added a trend line chart plotting **Total Records** against Check-In Date, so the front office can see how many guests are due to check in on each upcoming date.
5. Created a second dashboard page, **Dashboard 2**, restyled with coloured KPI bars for the same four summary metrics, and added a "Number of Guests" trend line, plus two additional bar-chart breakdowns — bookings grouped by guest city (from Permanent Address) and bookings grouped by record count — for a more detailed, at-a-glance operational view.

6 Previewed both dashboard pages to confirm all tiles and charts render correctly against the live Hotel_Room_Booking_Report data, and checked Report and Page permissions under Settings so front-office roles have the intended View access.

3. Output

The following screenshots capture the completed Report and Dashboard pages built for the Hotel Room Booking application.

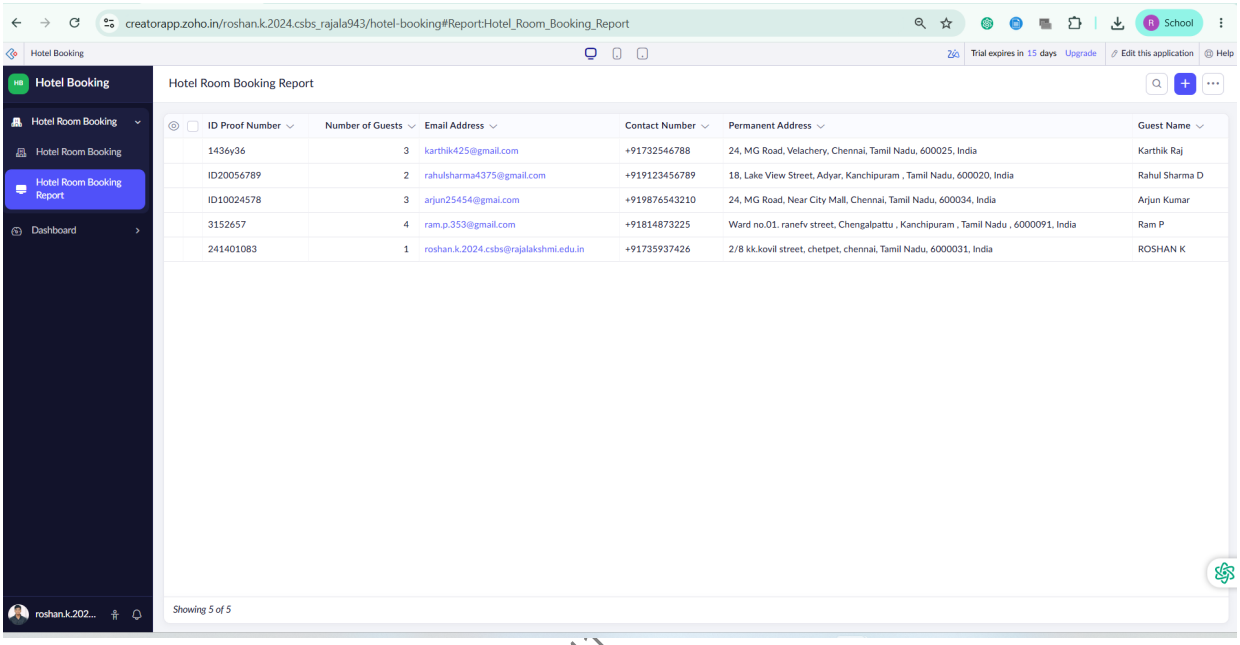

Figure 1. Hotel_Room_Booking_Report — sample submitted records with Guest, Contact, and Address fields.

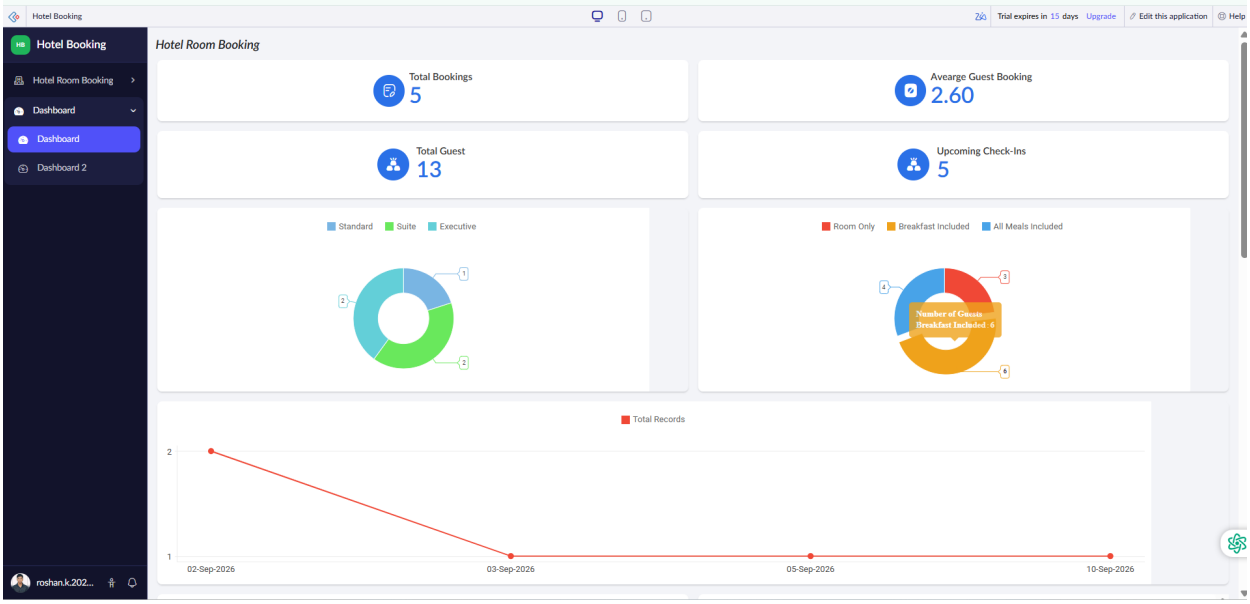

Figure 2. Dashboard — booking KPI tiles, Room Type and Meal Plan distribution, and check-in date trend.

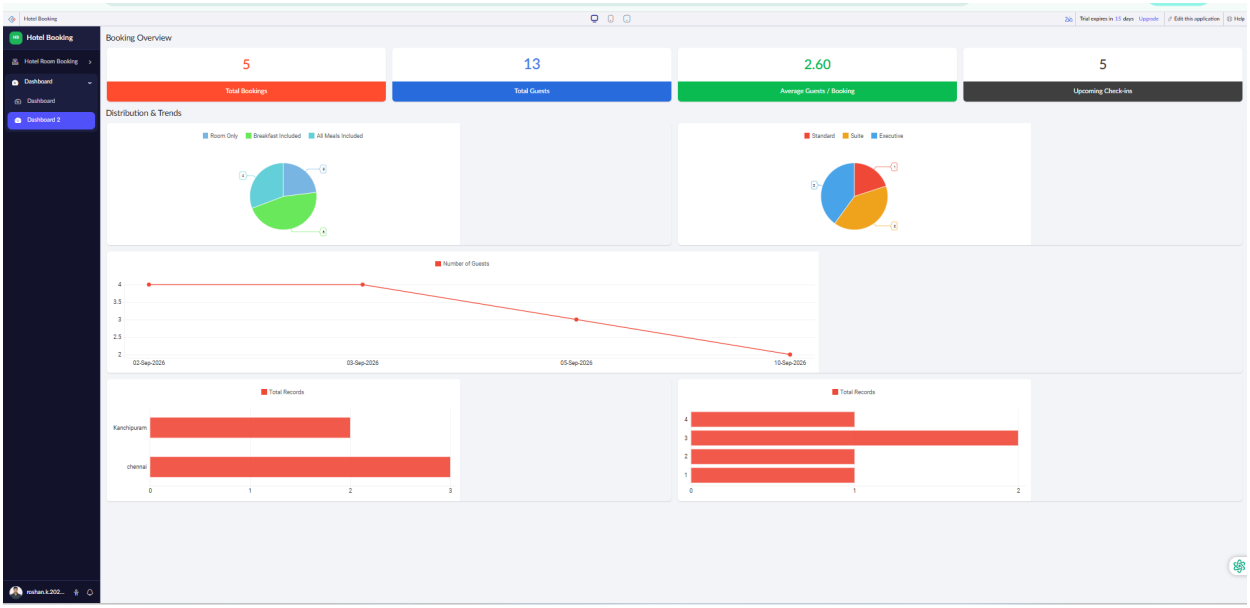

Figure 3. Dashboard 2 — restyled KPI view with guest-count trend and city / record-count breakdowns.

4. Result

A filterable **Hotel_Room_Booking_Report** and two UI Builder **Dashboard** pages were successfully built for the existing Hotel Room Booking application in Zoho Creator. The dashboards summarise total bookings, total guests, average guests per booking, and upcoming check-ins, and visualise Room Type and Meal Plan distribution alongside check-in and guest-count trends. This enables front-office staff to monitor booking activity at a glance, identify upcoming arrivals, and review guest preferences without manually scanning individual form submissions.
